The second secon

1.71

An embodiment of the present invention is a system and method for selecting a mirrored service in a network, such as the Internet, by utilizing a Border Gateway Protocol (BGP) attribute. According to an embodiment of the present invention, the BGP attribute, which may be stored in a border router, is accessed for each mirrored service for a prefix associated with the user requesting a host name. The attributes from each mirrored service are compared with each other to determine a "best" attribute which meets a predetermined criteria. The mirrored service associated with the best attribute is then selected as a resolution for the host name.
